AGENTS.md: instructions for AI coding agents working on Typographics Art This file tells AI agents (and
humans) how to work in this repository. Read it before changing anything. ## The project in one paragraph Typographics
Art sets a given text, character for character and in order, so that only the typography of each glyph (weight, width, size, colour) changes
and the page forms a picture. The text must stay real, extractable text. The three rules in `docs/technique.md` are the
contract of the project; no change may break them. ## Layout - `src/`: the library. Pure modules (`layout.js`, `tone.js`, `color.js`,
`render.js`, `typeset.js`, `fonts.js`, `options.js`, `lorem.js`) run in Node and browsers. `browser.js` needs a DOM: font
measurement, image reading, PNG output. - `index.html`, `gallery.html`: the web app and gallery for typographics-art.org. - `cli/`: command-line
tools that drive headless Chrome over the DevTools protocol (`core.mjs`, `render.html`), the renderer `tg-art.mjs`, the one-pager `onepage.mjs`, gallery
and asset builders. - `demo/moby-dick/`: the demonstrator (whole book as a poster) with its proof report. - `examples/`: one-pagers of laws, declarations and AI instructions. - `test/`:
Node's built-in test runner, no dependencies. ## Rules 1. **No runtime dependencies and no build step.** Plain ES modules only. CDN scripts in pages must be pinned to
an exact version with a Subresource Integrity hash. 2. **Fidelity is tested, not assumed.** Any change to layout, rendering or export must keep `isFaithful()` true and the
text extractable from HTML, SVG and PDF. Add or update a test in `test/` for every behaviour change. 3. **Pure logic stays pure.** New algorithms go into the
pure modules with tests that run under `node --test`. Only code that needs a DOM goes into `browser.js`, `cli/render.html` or the pages. 4. **Measure before claiming.** Numbers in the
documentation (fidelity, OCR rates, timings) must come from a script or test in this repository. Update them when the code changes. 5. **Keep outputs honest.** Generated
reports must state their method and limits. Never hide instructions in tiny text: a one-pager always shows its title, and its full text must be the declared document. 6. **English** for code,
comments, commits and documentation; German translations live in `README.de.md` and the app's dictionary. ## Commands ```sh npm test # all tests, under a second
npm run dev # app at http://localhost:8080 node cli/tg-art.mjs img.jpg --text t.txt -o out.pdf node cli/onepage.mjs doc.pdf --title "Title" -o onepage.pdf npm run gallery #
re-render gallery (needs
Chrome) node examples/build.mjs # re-render examples (needs Chrome and MuPDF; qpdf optional, shrinks the PDFs) ``` ## Before you open a pull request
- `npm test` passes. - For visual changes: render at least one gallery work or example and look at it. - The changelog has an entry
if users will notice the change. - The pull request says what changed and how you checked it.
